

Sandberg USB 1.1 Boost (2 ports)

The Sandberg USB 1.1 Boost is an elegant and cost-effective solution for increasing the number of USB ports on your computer instead of attaching a USB hub. Many external computer devices connect via USB, so the USB ports that came with your computer are all quickly used up. The Sandberg USB 1.1 Boost gives you two extra ports on a single card. Following the instructions in the detailed user guide, it is easy to install the card into a spare PCI port in your computer, and Windows® will then install the necessary software automatically. The card can also be used on computers that have no built-in USB ports at all.

USB device bandwidth up to 12 Mbit/s
Optimized logic design for highest bus bandwidth
Full support of realtime dynamic insertion and removal of devices
Multiple transfers of data and message streams between host and device
Supports up to 127 devices (concurrent operation)
Open HCI 1.0, USB 1.1 compliancy
Supports all USB compliant peripherals
Supports legacy keyboards and mouse devices
