

FireWire 800 is a super high-speed version of FireWire that can transfer data at up to 800 Mbit/s. FireWire 800 is well-suited as a data carrier when you need to send huge amounts of data over a network, send data between your computer and DV camera, or simply want to connect an external hard disk at super high speed. The standard is backwards-compatible with older versions of FireWire. Just like its predecessor, FireWire 800 also delivers up to 45W through the connector, allowing external devices to be powered from your computer. This cable gives you a solid and stable connection between your FireWire 800 devices.
